

Do Your Cognos Reports Make the Grade?

US Patent Pending

Motio ReportCard is an application designed to efficiently analyze, grade and document a wide range of Cognos content.

Find your answers. A complex BI environment lends itself to many important questions, such as: "Are our reports inefficient?", "Are we meeting company standards?", and "Is the environment healthy?" ReportCard provides a large selection of rules to analyze Cognos content and provide the answers you need.

Save money with documentation. Eliminate the cost of manually documenting reports. ReportCard provides a professional, cost-effective alternative for the documentation of Cognos BI content.

Cognos Report Studio integration. Through the ReportCard plugin, documentation is integrated into Cognos Report Studio. This allows functional metadata such as author, company information, etc. to be blended with the technical metadata in the PDF documentation.

Identify unnecessary development. BI projects, both large and small, can often lead to reports that overlap in functionality or do not meet business needs. Use ReportCard to identify duplications or unnecessary BI assets to reduce your development and maintenance cost; furthermore, removing the duplicates and unnecessary assets will increase the effectiveness for your BI consumer.

Increase Cognos audit data capabilities. Cognos audit data coupled with ReportCard rules enhances the ability of developers to pinpoint which BI assets are good candidates to remove or rework in the BI environment.

Community-driven rules. Due to the ever changing and complex nature of modern-day BI environments, ReportCard is designed to easily adapt to new rules. Consequently, the user community can constantly propose new rules which can immediately be incorporated into ReportCard.
